

The Bees Have Tech:

“Bees Have Tech”

What exists nearby

Bee Simulator already offers a bee-scale semi-open world, flight, pollen collection, threats and hive-saving, including dedicated multiplayer maps.

Goat Simulator represents the other half of your concept: an exploration sandbox designed around ridiculous abilities, physics interactions and the freedom to produce comedic outcomes. Its later content has continued leaning into large sandboxes, bizarre equipment and reactive chaos.

What appears much less represented is:

A technologically advanced bee civilization using absurd military, industrial and traversal equipment inside an ordinary human backyard.

That is where the identity lives. It should not simply be “Bee Simulator, but the bee owns a laser.”

Strongest version

The bee is effectively a tiny open-world superhero.

Possible tech:

- pollen pulse cannon;
- honey foam launcher;
- stinger grappling cable;
- wing overdrive;
- hex shield;
- miniature bee mech;
- swarm-command beacon;
- nectar refinery;
- hacked human toys used as vehicles.

The ordinary backyard becomes a giant systemic environment:

- sprinkler = weather catastrophe;
- lawn mower = roaming world boss;
- bug zapper = fortress or power station;
- dog = kaiju;
- soda can = industrial resource deposit;
- flowerbed = contested biome;
- shed = late-game dungeon.

Web buildability: 7/10

A **contained vertical slice** is very buildable in web tech.

Build one backyard corner containing:

- one hive base;
- one flower patch;

- one hostile wasp;
- one human machine;
- three tech abilities;
- breakable props;
- one ridiculous mission.

The challenge is not graphics. The challenge is creating good flight controls, satisfying collisions and enough interconnected physics for the comedy to feel intentional.

Best prototype stack

I would use **Three.js + Rapier physics + TypeScript + Vite**.

Babylon.js is also credible and includes WebGPU support with compatibility pathways back to WebGL.

For us, Three.js makes more sense because it aligns with your existing web-prototype experience and makes it easier to reuse controllers, camera systems and deployment infrastructure.

Best eventual platform

PC first, especially Steam, with controller support.

The commercial version should likely move to **Godot, Unity or Unreal** once the prototype validates:

- flight;
- comedy;
- toy interactions;
- tiny-world scale;
- tech ability combinations.

The final vision wants robust physics, dense levels, AI and perhaps co-op. Web is excellent for proving the fantasy but less ideal for producing the definitive large sandbox.

This is probably the **best franchise idea** of the group.

Bees Have Tech

This is my favorite.

Not because it's funniest.

Because it has identity.

Imagine the trailer.

"Scientists thought bees built hives."

"They actually built civilization."

Then...

Tiny mechs.

Laser pollen.

Drone bees.

Hexagon cities.

Honey-powered reactors.
Queen AI.
Robot hornets.
Pollination lasers.
Tiny railguns.

Tone
GOAT Simulator

High on Life

Pikmin

Honey I Shrunk the Kids

Bee Movie
without actually being Bee Movie.

Potential gameplay
Open sandbox.
Physics.
Flying.
Building.
Swarm RTS.
Weapon crafting.
Vehicle creation.
Tiny-scale world.

Even better...
Humans become gigantic environmental hazards.
A lawn mower becomes
a world boss.
A sprinkler becomes
a weather event.
A child becomes
a titan.

That scale inversion hasn't been explored enough.

Rating

Identity:

Virality:

Merch:

And then there's Bees Have Tech

This one is fascinating for almost the *opposite* reason.

I wouldn't try to make **Bees Have Tech** enormous yet.

I'd use the credits to discover whether it has **Goat Simulator–level stupidity hiding inside it.**

The premise itself is already the marketing:

Bees have technology.

No explanation required.

And because we're not constrained by realism, the tech can escalate absurdly.

Bee starts with:

 flight

then:

Scanner

Honey Welder

Micro-Laser

Tractor Beam

Bee Drone

Mini Railgun

Swarm Teleporter

Bee Mech

Orbital Hive Platform

And suddenly you've gone from:
bee flying around backyard
to

six bees operating a stolen human forklift using a hive neural interface.

That's a game.

More importantly, it's extremely friendly to iterative AI development because we can just keep throwing systemic toys into the sandbox.
